590DV Final Project Part 4 - Narrative Report

Based on Part 2

Final project's part 2 generates three visualization figures. Figure 1 visualizes the relationship between the awards amount and the awarded institutions distribution in 1996-2013. Figure 2 visualizes the relationship between the awards type and the awarded institution distribution in 1996-2013. Figure 3 visualizes the amount of different type of awards received in each state in 1996-2013.

The tools and libraries that are applied during the visualization include pandas, matplotlib, and plotly. The dataset is a csv document that has 43 columns.

I.   Figure 1: Awards Amount and Awarded Institutions Distribution (1996-2003).

This figure picks up four columns from the document, "Institution", "AwardTotal", "Longitude", and "Latitude". The visualization displays the total of awards that each institution has received in 1996-2013, and each institution is marked in the United States map based on its specific longitude and latitude. The total amount of the awards that each institution has received is divided into one of the five levels. Each level has a different range. Each level is marked in a specific color and each level also has a corresponding size of circle. (see Table 1)
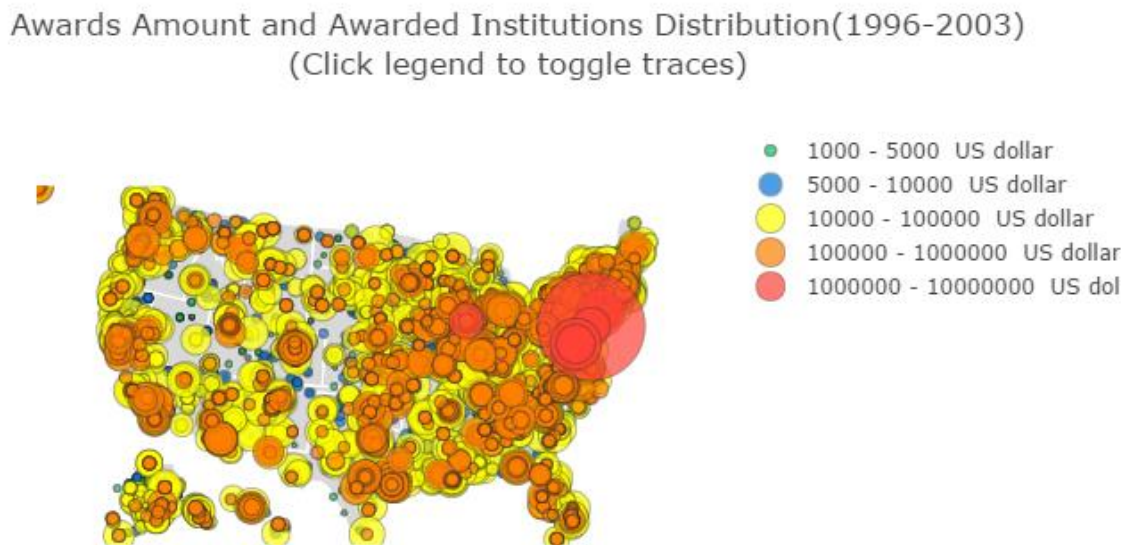

Table 1: Award Total by Level and Color

| Level	Level 1	Level 2	Level 3	Level 4	Level 5
Range ($)	1,000-5,000	5,000-10,000	10,000-100,000	100,000-1,000,000	1,000,000-10,000,000
Color	rgb(0,201,87)	rgb(0,116,217)	rgb(255,255,0)	rgb(255,128,0)	rgb(255,65,54)

Then for iterator evaluates each tuple. First, the award total is selected if it satisfies the level 1 requirement, then its longitude and latitude are collected, then its size is calculated, and the level 1 color is assigned. In a same way, all the tuples are assigned into level 2, level 3, level 4, and level 5, until all the tuples have been divided into different level.

Next, a layout function is written. This function provides the title of the visualization figure, shows legends, define the scope as the United States, paints the land color as rgb(217, 217, 217). It also defines the width of country and state border line, and sets their color as rgb(255, 255, 255).

Then, data that represent all the institutions, their total amounts of awards, and all the other related information, and layout are assigned into the "fig" function. And py.iplot finally puts all the above data into the visualization.

Awards Amount and Awarded Institutions Distribution(1996-2003)

- 1000 - 5000 US dollar
- 5000 - 10000 US dollar
- 10000 - 100000 US dollar
- 100000 - 1000000 US dollar
- 1000000 - 10000000 US dol

The following visualization figure also displays the total awards that are received by each institution during 1996 and 2013, but from another aspect. From this figure, it can be easily seen that how much awards each institution has received during the designated years. The figure also provides the following information: which institutions have generally received the most grants, which states have roughly received the comparably least grants, or on which average level the institutions have posed.

Total Awards Received by Institution 1996-2013
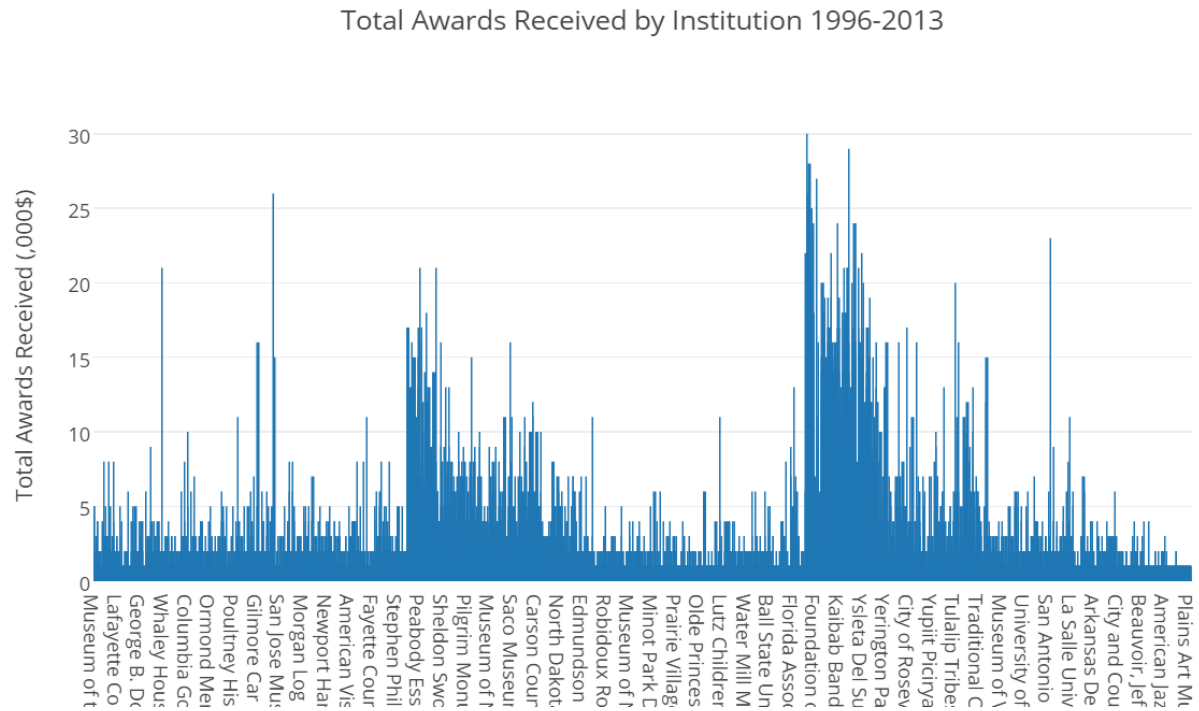

II.   Figure 2: 1996-2013 Awards Type and Awarded Institutions Distribution

Figure 2 visualizes the awards that each institution has received are assigned into 17 different program types. Each type is defined in a specific color. And each institution is marked into the United States map by using its specific longitude and latitude. Four columns are collected from the csv dataset, which are "Institution", "ProgramType", "Longitude", and "Latitude". Each program type is attributed with a particular color (see Table 2), and then each institution's awards will be displayed in the corresponding colors on the map.

Table 2: 17 Program Types by Color

No.	Program Type	Color
1	IM	rgb(0,201,87)
2	IC	rgb(188,143,143)
3	LT	rgb(135 206 235)
4	LG	rgb(255,0,225)
5	IA	rgb(61,145,64)
6	IS	rgb(218,112,205)
7	LI	rgb(255,235,205)
8	MA	rgb(135,38,87)
9	MH	rgb(61,89,171)
10	ML	rgb(30,144,255)
11	MN	rgb(189,252,201)
12	IG	rgb(255,192,203)
13	RE	rgb(94,38,15)
14	LE	rgb(255,0,1)
15	IL	rgb(255,255,0)
16	MP	rgb(255,128,0)
17	ST	rgb(163,148,128)

A "for" iterator is used evaluate each tuple, and assigns the corresponding data into type 0, and then collected its longitude and latitude, and assigned with color 0. Then the "for" iterator will assign the corresponding data into type 1, 2, 3, …., and 16. So far, all the tuples have been evaluated and assigned into each corresponding type and color.

Then "layout" function defines the title of the visualization figure, shows legend, sets up a scope as the United States, shows the land color as rgb(217, 217, 217), defines the width and color of both state and country borders as 1 and rgb(255, 255, 255).

At last, the data and the layout are assigned into "fig" function, and py.iplot visualizes all the related data on the United States map, where each award type is displayed in a specific color and localized into each institution on the map.

- LT
- LG
- IA
- IS
- LI
- MA
- MH
- ML
- MN
- IG
- RE
- LE

The following figure tries to display the same purpose from the two-dimensional relationship between program type and institutions, i.e. how many program types that each institution has received during the designated years of 1996-2013. The X axis represents institutions, while the Y axis program types. From the visualization, it can be found that MA, LG, IM, IC, and ML are the programs that are received by the most institutions. LE and LS are the programs that are received by the least number of institutions.

Program Types Received by Institution 1996-2013
III.   Figure 3: Amount of Different Type of Awards Received in Each State

This visualization figure displays the amount of each type of awards that the institutions in each state have received. The x axis lists the states, while the y axis displays the amount of received awards that the institutions in each state received in 1996-2013.

Two types of visualizations are displayed in figure 3. The first visualization displays how many awards that institutions received in the designated period. When the curser points at the vertical line of each state, a list of small boxes and numbers will appear, in which each box is assigned the color of that specific type of awards. In each box, there is a number that indicates the number of awards for the specific type, and at its right is the name of that award type. Another type of visualization is displayed by the trace lines. Each trace line represents one type of award. It varies in height by state. It can be easily seen the amount of each award type that are received in each state.

There are 17 trace lines, as there are 17 award types. Each trace line corresponds to the color of each award type. Three columns of "Longitude", "InState", and "ProgramType" are collected from the csv file.

Amount of Different Type of Awards Received in each State

A boxpilot figure here below is also utilized to display a partial aspect of the abov Figure 3 purpose, which interprets the relationship between the program type and the states during the designated years of 1996-2013. From the box plot visualization, it can easily be concluded which program types that each state has received, what median each state stands in the types of awards. It also indicates the maximum number of awards and the minimum of awards that are recevied by each state. The outliers are marked in dots, which makes it directly perceivable in detecting those awards that are rarely received by each state.
Program Types Received by State 1996-2013
## IV.   Top 20 Awards Total Received in 1996-2013

The following visualization figures shows the top 20 awards total received by institution. From the pie chart, the largest awards receiver is the Museum of Aleutians. The bottom 11 institutions received a same level of awards each totaling roughly $999,999, which are respectively Los Gatos Museum, Gold Nugget Museum, Kimberly Crest House and Gardens, Maritime Museum Association of San Diego, Los Angeles Maritime Museum, Discovery Science Museum, Santa Ynez Valley Historical Society, Fort Collins Museum, Golden Pioneer Museum, Housatonic Museum of Art, and Guilford Keeping Society.

Top 20 Award Totals and Receiving Institutions 91996-2013)

Legend:
- Museum of the Aleutians
- Depot Museum, Inc.
- National Voting Rights Museum and Institu
- Bob Jones Museum
- Coronado Museum of History and Art
- Hayward Area Historical Society Museum
- Sun Gallery
- Coachella Valley Historical Society
- Los Gatos Museum
- Gold Nugget Museum
- Kimberly Crest House and Gardens
- Maritime Museum Association of San Dieg
- Los Angeles Maritime Museum
- Discovery Science Museum
- Santa Ynez Valley Historical Society
- Fort Collins Museum
- Golden Pioneer Museum
- Housatonic Museum of Art
- Guilford Keeping Society

The following figure shows California is the state that receives the most of the top 20 awards total, taking away 11 of the 20. AK, or Arkansas, is the state that receives only one of the top 20 award totals.

Top 20 Award Totals and Receiving States (1996-2013)
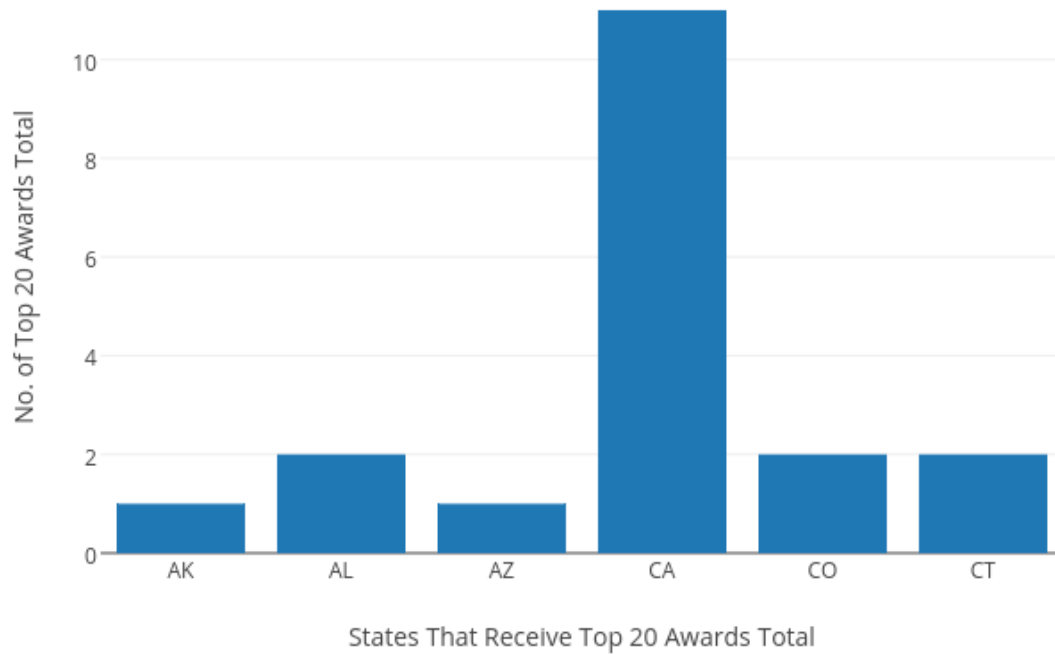

The following figure shows that all the top 20 awards totals are of just one program type, IA.

Top 20 Award Totals and Program Type (1996-2013)
